Hi Christoffer

We are having a mixture of Windows 2000 with service pack 4 and Windows 2003 servers

The Users are not in the local administrators group or any other local group on the remote machine.

They can get into remote PC where they are not members of any group and play around with shares, event viewer etc

I would expect this capability only for administrators group on the remote machine.

How can I turn off access to non-admin users

Thanks in Advance

Kiran
