Hi Michael

I guess my first question is what objects are in the OU to which the policy is linked? You seem to be saying that you created a group which contains the computer accounts for the XP SP2 client and the 2000 client. If it's the case that you've only put the group in the OU instead of the computer objects, this explains it. Policy will only apply to the actual computer (or user) objects that exist in an OU.

Secondly, the Windows Firewall comes with some default exceptions. You can view these in the Exceptions tab of the Windows Firewall applet in Control Panel. This might explain why your tests for connectivity have been successful.

Lastly, running a `gpresult /z` (Win XP) or a `gpresult /v` (Win 2000) will show you which policies have applied to the computer and currently logged in user. If you pipe this to a text file, it makes for easier reading.

HTH
