That error, if persistent, means the netlogon secure channel is out-of-sync (or non-existent).

Run nltest /sc\_query:domainName on this machine, and see what the outcome is. If it fails, or gives an error try resetting it: nltest /sc\_reset:domainName.com

We get this kind of error on the DC system log:

Event Type: Error

Event Source: NETLOGON

Event Category: None

Event ID: 5723

Date: 11/18/2004

Time: 10:28:25 AM

User: N/A

Computer: AD

Description:

The session setup from computer 'CR02-EMBT30' failed because the security database does not contain a trust account 'CR02-EMBT30\$' referenced by the specified computer.

USER ACTION

If this is the first occurrence of this event for the specified computer and account, this may be a transient issue that doesn't require any action at this time. Otherwise, the following steps may be taken to resolve this problem:

If 'CR02-EMBT30\$' is a legitimate machine account for the computer 'CR02-EMBT30', then 'CR02-EMBT30' should be rejoined to the domain.

If 'CR02-EMBT30\$' is a legitimate interdomain trust account, then the trust should be recreated.

Otherwise, assuming that 'CR02-EMBT30\$' is not a legitimate account, the following action should be taken on 'CR02-EMBT30':

If 'CR02-EMBT30' is a Domain Controller, then the trust associated with 'CR02-EMBT30\$' should be deleted.

If 'CR02-EMBT30' is not a Domain Controller, it should be disjoined from the domain.

For more information, see Help and Support Center at
