Audit Account Management is LIKELY what you wish, even
though it doesn't meet the technical requirement of auditing
"every" change by an admin.

Account Management auditing will cover (most of) the things
you care about, but if you need most control or granularity you
can also audit specific Directory or File objects after turning
on Direct or File object auditing IN GENERAL.*

*The key point about auditing "objects", is that you must both
turn on the auditing in GENERAL and also set the auditing on
the specific objects (done with properties like permissions.)
