the variable is %username%. So your syntax would be:

```
net localgroup administrators yourdomainname\%username% /ADD
```

That would add ANY user that logs into the computer into the administrators' group IF you are using Machine Startup Script through a GPO as suggested by Oli. This may be something you want to do in a controlled fashion.

You can set a day when you will tell your users "if you want to get admin rights on your computer, please reboot your computer at 10 am tomorrow and log back in, etc, etc". Then you will enable this policy at, say, 9am on that date and take it off at 11am.
