I am not sure that there is any limit. AFAIK, I could go to each and every computer in a 1000 computer environment and log on to each and every computer. That is, unless there is a setting in my user account properties limiting me to logging on to certain computers or some GPO that denies logon locally.

Now, let's look at the two possibilities that I mentioned. These two will limit a user to logging onto only those computer accounts specifically mentioned in his / her user account properties –OR– prevent a user from logging into those computer accounts that fall under the Scope of Management of the GPO that denies the logon on locally to a specific group (of which the user account object in question would be a member).

I am not sure where the limit of 60 originates. About the only 'limit' where the number is '60' of which I have any knowledge is the tombstone time limit. Not really sure where Jesse is getting this number.

Now, is this an answer to your question?

Or, as Ryan suggests, are you asking about a way to prevent a user from logging into computerA and then logging into computerB (while he / she is still logged onto Computer!). Both the Network Share and CConnect would be the way to prevent this....bas per the MSKB Article that Ryan provided.
