I have a Windows 2000 SP4 domain. I am trying to get LDAPS working for Windows services for UNIX. I have already extended the schema for UNIX and I have installed Certificate Services on my domain controller.

However, when I attempt to use ldp.exe to connect to my domain controller on port 636, I receive message:

```
ld = ldap_open("dc01.domiain.com", 636);
Error <0x0>: Fail to connect to dc01.domain.com.'
```

I am able to connect successfully using port 389 however.

I have LDAPS working successfully in a test domain but I can't find what is causing the difference between test and production.

Any words of wisdom would be greatly appreciated.

.
