Not necessarily. For instance none of my programs require admin to install, you only need write access to some part of the file system. You need admin rights if you are writing to some portion of the system that only allows admins to write such as parts of the registry or file system.

This isn't something that can be completely blocked for this very reason. You can not set up ACLs in NTFS to block types of files. It is all just data.

Are they members of the domain admin group?

They need to be *some* kind of administrator to install programs.

No. It is not a member of local administrator group

"Danny Sanders" wrote:

Re: User Rights

I found a user who has

installed applications to his windows xp machine in D drive. I need to restrict them installing application by their own and i also need to allow them to save their data to D drive. These users are in domain user group.

If their domain account is a member of the local administrator group remove it.
