Hi Guys.

I'm testing an AD Migration from a domain in one forest to another domain in another forest. We have been taken over by another company and i have to migrate our users/PCs etc from our domain into the new companies domain.

I have a test setup using Active Directory Migration Tool v3.0 between our main domain and a test domain we already have.

I have installed the Password Export Server Service, set up DNS replication both ways and set up an External 2 way trust. I'm not given the option to set up a Forest Trust for some reason. This may be the problem, as I cannot enter the admin accounts from the source domain into the domain admins group in the target domain or vice versa.

When I try to migrate a user using ADMT on the Source domain, I can go all the way through the Migrate Users wizard but the migration fails with an Access Denied error. If I try to run the wizard on the Target DC, the Wizard fails on the "Password Options" screen with an error:

Unable to establish a session with the password export server. Access is denied

Is the access denied error caused by the type of trust I have created? If so, why does the Trust Wizard not give me the option for a Forest type Trust?

Thanks

John
