Go to the new print server and alias the name to the old server. Enter the old server name in DNS. This way your new print server will handle old and new names the only requirement is the share name is going to have to be the same.

Part of the logon script attached to a GPO, is for mapping a LPT port.

The printer that it maps to is dead, so I changed the script to point another newly installed printer.

The problem is that when user logs on, the system still attempts to find the old printer and flash's up a connection error message stating that the printer cannot be found. Ticking the "do not reconnect in the future" option and hitting "No" to continue the connection.. Gets you in ok. And the correct printer has been mapped.

The next day when users attempt to logon, the same message comes up.

What can still be telling the system to try the old mapping?

Thanks
