Hi all,
I'm new to active directory. I want to know how to setup
Domain in
windows
2000 server environment. I've been working with peer to
peer network
uptill
now and am planning to learn domain networking.
For practice I've setup two computers. one with windows xp
professional
&
the
other one with windows 2000 server. I've installed active
directory but
don't
know how to administer it. In the sense how to connect to a
domain? How
to
create users & assign them rights? etc.
Is there anyone who can help me out in this regard?

This is a topic that numerous books have been written about. You could
compile thousands of pages on how to administer an Active Directory
domain.
I would recommend you check the local used bookstore for some intro level
books on Active Directory.

Also, it is amazing how many people will never both to
even check the help. Located in the Win2000+ help are

Re: Active Directory Setup & Administration

(very) MANY "checklists" as well as overviews, troubleshooting, etc on practically ever aspect of Windows setup and configuration.

Search for "checklist Active Directory" (or anything similar.)

If you cannot think of a good keyword to search then just try "checklists" to see a checklist of all checklists.

There are also numerous "Step-by-Step" guides on the Microsoft website so googling something like this works great:

[site:microsoft.com "step-by-step" KEYWORD]

KEYWORD would be replaced by any specific keyword(s) or quoted phrase(s) you wish help understanding.

The main disadvantage of the Step-by-Step guides is that they are literally step by step and can be quite long but if you truly don't understand a subject then they can make a fantastic tutorial resource if you just carry them out.

We will help. Try something. Ask questions. Tell us specifically what your problems and goals are and someone will practically always be willing and able to help here....
