Thanks for respond, very appreciated. Here's more explication:

When I was applying some Computer group policy in my domain (domain controller), it is affecting my entire computer even if I am not logging on to my domain (with my client machine).

I was wondering if it was normal that my domain can change policy that change the behaviour of my workstation even if it is disconnected from the domain. (Conncted to a workgroup by example).

thanks

Ok, i'm pretty new to active directory but I'm doing some test and found something that is very strange.

I have a client machine (windows XP) as well as a windows 2003 server (Domain controller) and I have added my client machine in the domain. I have added a group policy in the domain controller which has the authenticated user has the security filtering.

Let's say that I define the change system clock policy in computer configuration, windows settings, security settings, local policies, user rights to be no one.

It is doing the good behaviour when i'm logging to my domain in my client machine (I can't change the system clock) but the problem is even if i'm connecting LOCALY to my client machine, i STILL can't change my system clock.

Re: What's happening ? Group Policy problem

What do you mean? With a LOCAL account defined on the client computer?

(Domain) Group Policies have no control over non-Domain users --- except by controlling the machine itself.

User policies affect domain users --- Computer Policies affect domain computers.

BUT the domain policy still affects that domain machine as a computer which MAY restrict what a user can do.

It's seems that the domain group policy override my client pc when i'm logging localy.

How come ? How can we explain that ? any info on that is very much appreciated.
