Hi,

I have a Win2k Domain with three DC's all on service pack 4. There is one server running Exchange 2000. There are also a mix of 2000/2003 member servers in this Domain. I plan to install a new server, which needs to be a domain controller, running Windows 2003R2.

Running a similar setup using Virtual servers, I am trying to "pratic" the install before doing it in the live setup.

Re: New 2003 DC

I have read as much as I can on installing a new 2003 DC in a 2000 domain, and have tried to run adprep /forestprep on the DC, I get an error:

"Adprep was unable to extend the schema.
[Status/Consequence]
There is a schema conflict with Exchange 2000. The schema is not upgraded.
[User Action]
The schema conflict must be resolved before running adprep. Resolve the schema conflict, allow the change to replicate between all replication partners, and then run Adprep. For information on resolving the conflict, see Microsoft Knowledge Base article Q325379."
"

The article given isn't the most helpful, as it is more for upgrading rather than a new install into an existing domain.

Thanks in advanced

My guess is you are using disk1 of R2, use disk 2 of the two disk set for the R2 o/s:

"To update the schema, on the schema master domain controller, insert Disc 2 and open the command prompt. Then, change to the

Re: New 2003 DC

Cmpnents\R2\Adprep
folder
of Disc 2, and type: adprep.exe /forestprep"

See my article on upgrading your forest to 2003 at:

<http://www.pbbergs.com>

Select articles and click on Upgrade Your Forest

Nope, using the 2nd Disk. Have run DCDIAG and it came back with no
errors at all, everything passed.

What do you mean by nope?

I thought you were trying to extend your schema?

I meant, nope, I am not using disk 1 of Win2k3 R2, i was using the
second disk, actually I have used both to no avail.

I just want to add a Windows 2003 DC to an existing Windows 2000
Domain, but I keep getting the errors when running adprep....
