Hello Jolyn,

Was the crashed machine the FSMO role holder? Did you move them before to the other DC? From the output you posted, it is node1. So please give some infos about server names, which is the old, which is the running and which is the new one.

Also it seems that you have not removed the old entries from Active directory after starting the rebuilding. Just deleting is not enough and also using the same name is giving conflicts. So please describe more detailed what you have done.

Here are some links about moving/seizing the 5FSMO roles and removing orphaned dc's from active directory:

How to remove completely orphaned Domain Controller

Hi,

Urgently need solutions for the following error.

Originally I have 2 DCs. Due to the fact that one of them have problem, so it was reformatted and promote as a 2nd DC again. I log in to windows as Adminsitrator user.

Re: Unable to local DC URGENT

Now I have many errors:

(1.) On the new 2nd DC, i have error in system log every 2 min, Evend ID

16650 from source SAM stating "The account-identifier allocator failed to

initialize properly. The record data contains the NT error code that caused

the failure. Windows 2000 will retry the initialization until it succeeds;

until that time, account creation will be denied on this Domain Controller.

Please look for other SAM event logs that may indicate the exact reason for

the failure."

(2.) On both DCs, I have Event ID 3096 The Primary Domain Controller for this domain could not be located.

(3.) On both DCs, I'm also unable to open/access Domain Controller Security Policy or
