Hello All,

I have setup a new domain controller on a win2k HP DL380 G3 box in two of my remote locations. However, when I remote control these machines and go to Active Directory to configure a user account, I do not get the Security tab. I need the Security tab to allow certain user permissions such as to change password. The change password restriction is disallowing my users to change their password at logon.

The unusual thing is that my primary domain controller in my home location and an older domain controller in another remote location both on IBM Netfinity boxes allow users to change their passwords because they show the Security tab and allow me to change the permissions.

What could be so different now then before when I configured my domain controller and active directory services. How do I get my Security tab back?

Majid
