I don't quite follow. What errors? In your original post you mentioned
some unexpected content in the body of the receive e-mails. If you
observe errors, please quote the text.

Also: do the commands ever produce the output you expect, or do they
always fail/produce unexpected output? As I wrote before: when they
fail, what's the content of the .log files?

My question aimed at the condition when the file mentioned as -file in
the "postie" command doesn't exist. To be safe, you could start your
script with:

ECHO This is my error log:>c:\temp\errsysdes.log
for each kind of .log file, and then replace all single redirection
symbols (>) in the "logparser" command with double ones (>>).

>I can try to delete temp files on exit
