Hi

I am running an Application which needs to logon to exchange Server, Since Whenever Code to connect to Exchange Server is called Program shows me outlook client login Screen on which I need to logon (Exchange Server is on different network).

To avoid this problem I thought of using RunAs.exe but now I Ran into another problem, My application has some log files in which it writes log information but now after starting the application using RunAs.exe (The domain name, username and password information which I am giving to Runas is the same using which I need to logon to Exchange Server) No log is being written to the log files...

I am not sure what is happening, when I am not using RunAs.exe, everything is working fine except that I am asked to logon to exchange Server, but when I am using RunAs.exe I am not being asked for logging on to Exchange Server but No log is being written so I am unable to know if my Application is working correctly or not.

Hard to say without seeing any of your actual code, but I suspect that the account whose credentials you are using lacks the access to write the log files.

/Al
