Hi Ace,

I think that was my post at EventID, matches what I submitted. We've gotten a few more 7050 errors that was not my co-worker doing a port probe -- the new 7050 events happened at about 2:30 am and 3:30 am est 6 days apart on all four DNS servers (two are AD empty root, two are AD child) at HQ. Interestingly, too, even though all 4 servers in same switch, our 2 AD Root servers also reported 7050 on two other days at 11 am and 2 pm respectively, whereas the child servers did not. The 11 am and 2pm I can possibly see as port probes (most of HQ is software engineers), but 2:30 am and 3:30 am?

None of the DNS servers are public, all internal and AD structure hidden from Internet. DNS looks fine, no one is having problems, no other errors (System, Application, Directory Service, NTFS, Security logs).

I still think first occurrence was port probe, too much coincidence that 7050 occurred on every DNS server exactly when port probe done. But I'm back to investigating cause of newest 7050s, if same cause or not. Did a Google search, saw this thread and thought I'd post the additional info. Still investigating.

No need to reply.

Regards,

Joan
