I have two Windows 2000 Advanced Servers, one server located at the head office and the other one is on a remote location. Both have their own domain, landmark.edp and landmark2.edp, both have AD installed. Both servers also were installed with SQL 2k Enterprise Edition. I'm trying to update the both database using replication of SQL, i have successfully connected to the remote location using dial-up connection from the head office(which is modem dial-ups is my only way to connect), but i can't register the remote server to my head office server using Windows Authentication. How can i authenticate registration of my remote server?

Is it possible, by demoting the remote server's dc to child domain of the head office server?

Thanks.
