

DNS/RFC and includes

Guys,

If you check the DNS RFCs, you can see that we can use a \$INCLUDE parameter in the Myzone.dns file to ask the DNS service to include all the records that are in an external file

For example :

```
MyZone.DNS
  $include Countrya.dns
  $include countryb.dns
```

It is very nice if you have a lot of names and if you want to split them in different files.

Here is my question ...

According to the RFC (which is in UNIX) we can specify a full path to the include files... but on Windows it does not work.. and I don't want to have my file in the c:\windows\system32\dns directory...

I tried :

```
$include c:\mydir\mars.dns
$include "c:\mydir\mars.dns"
```

.. but when I start the service, it appears in red in the MMC.

Do you have any advice ? I am stuck ..

Thanks for your help

Regards
