Hi,

I'm quite new concerning configuring DNS.  
Have the following problem (Possibly there's a straightforward answer to this)

I have a domain controller installed (address = 192.168.99.99) with domain name "example.be", also DNS server.  
The connection through internet is going through a cable-modem-router (now with firewall disabled) with address 192.168.99.1

Preferred DNS server on the client is 192.168.99.99 and alternate DNS is 192.168.99.1 (in router)

I can visit every internet site, except [www.example.be](http://www.example.be)

When I change the preferred DNS server to the old one (router) 192.168.99.1, everything works fine, but that's not what I want.

Probably, I have to add something in the DC-DNS server, but I don't know what exactly...

many thanks,  
Frank Lommelen.

---
