Hello folks,

I would like to get some knowlege from you Windows gurus :)

Our win admins have setup 2 win2000 servers with AD and also internal DNS services are running on it. So far so good. The first server has IP 10.0.0.11 and the second one has IP 10.0.0.34. They also set the secondary IP address on the second server 10.0.0.12. I don't know why they need a secondary IP ...

With the GPO the admins have force the DNS IP to our PC's. They are forcing the IP 10.0.0.11 and 10.0.0.12 as DNS servers. They are forcing the secondary IP address of second server as DNS server.

Could we run in some DNS problems if DNS is running on secondary/virtual IP?

thanks

.
