You're right as I had mentioned "[it is routed the[through] hq]" hq  
Box 1 is my switch that confines me to my LAN.

The Box2 and 3 are switches that gives internet access.

T1 to the router and router to switch 1/2

The question I am trying to make is what aspect of the Active  
directory do I enter in the new IPs. We already have the current  
information entered for DNS.

Can I add another DNS information to DNS?

Is there such a things as 2 DNS?

All Active Directory domain members must use only DNS servers that support the AD domain. If the DHCP on the T1's router are not assigning DNS servers that support the AD domain, they cannot be used on Domain Members. The recommended configuration is to run DNS on your DCs and use the DCs' addresses ONLY for DNS. Don't use any DNS server that does not support the AD domain on any domain member, in any position.

If you're having drive mapping problems it is because you don't have proper NetBIOS resolution, and the DNS servers cannot resolve the file server's IP.
