Hello. I've searched through this group trying to find the answer but the things that look like they would work havn't for me. I have 4 servers but I'm working with two of them. ServerA is running Windows 2003 standard with AD, DNS, WINS, and file/print sharing. ServerB is running Windows 2003 Web Edition with IIS6. My domain is "domain.local". I've setup DNS for the domain and all the other servers are resolving correctly. I can ping "ServerB.domain.local" just fine. Now I want to host a site on ServerB called "MyWeb" (no .com, no www). I make a site on the IIS6 box and set the headers to "MyWeb". I then tried adding a new forward lookup zone called "MyWeb" with a single blank A record pointing to ServerB's IP address. This is not working. When I try to access it I get no response and trying to ping it does not resolve. What am I doing wrong?

I can't find where you resolved this, it is quite easy to resolve, create a new host (or Alias[CNAME]) named myweb in the domain.local zone. Then, assuming domain.local is in the DNS suffix search list of all clients needing access, it will work. I would also recommend adding a host header for myweb.domain.local but it's not required.
