I understand your comment on SOA externalDNSserver. I did an edit on www delegation changing to ns415.hostgator.com ns416.hostgator.com with the appropriate ip address. I can ping the ip address, successfully. I can ping ns416.hostgator.com, successfully. I can do this on the internal computers, successfully, and the external computer, successfully. I am unable to open our web page using the IE browser, internally.

I went into the server room to inspect the PDC. Using the browser I was invited to log in to the web site? This event was unexpected. Once logged in as Admin the cryptic message stated: "You do not currently have a default document set for your users. Any users attempting to connect to this site are currently receiving an 'under construction page'. And that is exactly what is happening internally. This login feature, and the message delivered, is -unexpected. This anomaly should have been corrected long ago. These last several weeks our ad department agonized wanting to have unfettered access to the web site. Is there a solution with this current development? This scenario is totally unexpected. I can't figure out what is unfolding behind the scenes. At least the delegation fits and I am most appreciative. Again thanks for your attentions.

Ok, maybe I am misunderstanding your setup. Maybe it's me? I am getting somewhat confused with your responses and your configuration as you are

Re: DNS Internet

describing it. I think it maybe coming down to terminology and not being specific on your part? I am not sure, therefore I am asking you to be very specific in future responses.

1. Are you sayin your website is hosted externally AND internally?? Or is it just externally?
2. When you went to the server room to "inspect" your DC (notice – there is no such thing as a PDC with Windows 2000 and newer, that is an old NT4 term), what was the exact URL you type in the browser?

Note:

If you typed in <http://laeyeworks.com> and you got your local machine's website or one of the DC's IIs, then that is TOTALLY expected. If you did not get that, then I would imagine something is wrong with AD.

Yes. It may be terminology. Sorry. I'm from the NT days. The website is hosted externally. Within the company we would want to simply type in www.laeyeworks.com – Which is what I did at the client machine(s). I elected to log into the Server (DC). I opened up IE. I typed into the address bar www.laeyeworks.com. I did not type in <http://laeyeworks.com>. That's when (all this is new to me) the login interface appeared prompting me to log into laeyeworks.com. Username; Password; Domain. That's when the cryptic message appeared. And to my surprise IIs type information was presented.

We never did use IIS. Internally the company is a database/ financial enterprise. It looks as though the sysadmin may be experimenting. I don't know.

The web site is hosted externally. If the ad department wants to alter content the web creator is instructed. When the website is updated (externally) our ad department is notified. That's when they go onto the webpage to view the update. However, recently, the last several weeks, we have lost that ability to view our website.

I hope this comment helps. And I apologize for my amateurish non technical syntax.
