hi all

i am trying to access NTFS file system during boot time

can i just go thru the cluster datarun entries in the \$INDEX_ALLOCATION (0xA0) attribute and access all INDEX RECORDS belonging to directory or do i have to go thru the b+ tree to traverse entire directory.

I have written a small program that takes datarun entries from 0xA0 and traverses a directory .

it works well in WINXP

but not in WIN2000

can any one suggest whats the problem

regards

sushil
