Gentleman & Ladies,

A problem has cropped up using windows explorer. I have set the desktop and the explorer views to view web content. For some unknown reason windows explorer will not display a thumbnail copy of a jpg file selected in the right pane. Normally, before this condition occurred when a jpg or gif file was selected in the right pane a thumb nail copy of this file would appear between the center divider and the list of files or folders below text describing the file. Now the ONLY image that displays is a PSPIMAGE file native to Corel Paint Shop Pro ver 11. One might think that installing that software caused it but not so I had this problem before installing that software. Clicking the view option while in windows explorer there is a wizard option called "customize this folder". In this wizard there are four options with a sample view. The STANDARD option shows how explorer used to display the thumbnail, the IMAGEVIEW option is similar but the view is larger. Neither one of these options will work now.

Any Ideas?
