Hi,

Can this be done first?

I wish to configure remote clients to only access network resources (at HQ) if they have a certificate installed (I plan to use Windows 2003 Enterprise Server). If a client does not have a certificate and is trying to connect from a certain IP address range then they will not be able to access any network resources.

The reason I thought of certificates as encrypt all the data. The end user will be connected to a wireless network.

Does this make sense?

thanks
