This is quite weird: based on your instructions, I can get to, see and highlight all jpg files (which are called Active Server files in the File Type column despite being JPG files) in that folder but when I try to drag and drop them to a my documents folder in order to view those jpg files, what actually gets transferred are ASP files (of the same size as the JPG files, mysteriously exactly 165 kb in each file).

There seems to be some sort of password protect feature in those files which prevents you from looking at them unless you laboriously click on and download each of 571 different pages having originally logged on to the web page you have synchronised and entered the password. (and only 71 of the files did download in the sync process to my hard drive, possibly because it then decided all these files were taking up too much space?)

Is there a way to transfer these files as jpg files or convert them to another file type if they are saved as active server files?

How do I avoid this?
