After I ran SFC on my Windows 2000 computer, the Event Viewer shows that about 95 files were checked. Every file has the same information:

â€œThe system file could not be copied into the DLL cache.â€

When the scan is finished, there is this information item:

â€œWindows File Protection file scan completed successfully.â€

My question is why the files were not copied into the DLL cache, and how is this important. The reason I ran the SFC is that my windows boots normally only every other boot. On the first boot it hangs right after the startup theme sound (there is an hourglass and no icons are on the desktop). Then I do ALT-CTRL-DEL and restart the computer which then boots all the way. The file ntbtdlog.txt in the windows directory is the same regardless whether the boot completes normally or not. Any ideas how to correct this?
