I am sure it is not Policy. All the PCs are in the same OU. No policy is set, and the effective policy on each machine is Not Configured for the policies relating to this.

All our machines are installed by RIS, and nearly all applications are installed by Group Policy. All the machines show the messages when they are being built, but at some point the messages stop. A wide range of machines are fine: they just have nothing in common. It can't be the software, as its the same software on machines that work as on the ones that don't.

It just seems to be a random bug.
