Greetings!

I am trying to make my win2k pro machine more secure due to recent problems that caused me to have to reformat and repartition my harddrive and reinstall. I used to run my computer using the option presented upon install that tells windows to assume that a single user is always logged on. In spite of firewalls and antivirus I suspect that someone snuck something by thrashed my file records. I have been using windows for quite a while but have never taken the time to learn anything about it except how to do the basics that I need. I have been told that it is a bad thing to stay logged on with Admin rights, especially while surfing the web because it exposes your computer more easily. I have followed this advice and created another user with restricted privledges that I intend to use most times except when I need to install stuff. Problem is, I can surf the internet just fine while logged in as Administrator, but when I log in to my restricted account...I can't connect. How can I make the internet (and all installed programs for that matter) accessable to my restricted account so that the only time I log in as Admin is when I need to install more stuff?

Thanks,
Mark
