I've installed a new 2003 SP1 server and created a new volume.
I've created a folder on the new drive "D" called "website" and under this is a subfolder for each username.

The default permissions at the top level "website" folder are as follows:

Administrators – Full
Creator Owner – none
Interactive – List
Network – List
System – Full
Users – Read and Execute, List, Read

Then each username folder has the following permissions, after changing their "Home folder local directory":

Administrators – Full
username – Full

There is a website that runs on the server under "website" and each username is each users site. To allow "public" browsing of the site, I did add the "IUSR_SERVER" to each user directory and give it only the "Read" permission.

1. Did I setup the permissions correctly?
2. Should I change anything?
3. Can someone tell me what the "Interactive, Network and System users/groups are?

Thanks.
