We were observing the event on an XP workstation. In addition, the workstation would not honor all group policies (application of policies would fail at an unknown point). The symptom was logging this event and the workstation would not honor Security Auditing of the Default Domain Policy (among others).

We followed Microsoft's KB324383, 'Troubleshooting SCECLI 1202 Events' (see <http://support.microsoft.com/?id=324383>). No Joy.

Opening the Local Security Policy snapin produced an error. We renamed the local security database, and rebooted. All now appears fine. The database in question is secedit.sdb located in %WINNT%\Security\Database\
