Hi all,

I have one requirement in which i have to show last login information of the administrator after each successful login into system. the Information to be displayed could be in the form of banner.

I have to Last login date time, Number of unsuccessful login attempts made by current user before successful login, Location of workstation when the current user have last logged in.

Now, Here i have tried lot of VBScripts. for Lastlogin datetime I have used LastLogin variable but the date time i have got shows current session login time. Suppose the Adminstator has logged in yesterday and administrator logges in today then lastlogin should show yesterday's login datetime not the current session. I have tried to use lastlogoff property but seems it is not updated.

BadPwsCount property is also does not return any value.

I am not using Active Directory or LDAP on Windows 2000 Server.

Please help me out with this problem.
Any help will be appreciated.

Thanks In Advance

Alpesh

You could place this batch file into the Startup folder of the "All Users" profile:

```
@echo off  
echo %date% %time:~0.5% %UserName% >> %SystemRoot%\logon.log
```

Re: Help needed to get last login info of currently logged user

Now get your script to read the second line from the bottom in logon.log.

.
