Hi folks

I need to create a local account on a standalone server (non domain member) which will have the ability to create local user accounts, but not mess with the administrator account (thinking member of power user group here). In addition to this I need to make sure that this user cannot browse the network in anyway and only be granted specific permissions to certain directories. The permissions to the directories can be performed by locking down with NTFS permissions but I cannot find a way to disable network browsing without messing with the server service which is required for user account management. I need to hide all network servers/domain from this specific user account. What is the best way to acheive this, is it possible?

TIA

AndyJ
