You can not configure Account Policies from a Site linked GPO and have them apply to ALL domains in the forest. The ONLY location to configure Domain Account Policies is at the GPO linked to the domain, in each domain.

Also, it is usually not recommended to configure Site GPOs, except for rare and unique instances.

I have 4 sites and 4 Domains in my Active Directory that are seperated by a WAN link. I have created a Default Domain Policy at the root Domain and have applied this policy via the AD Sites and Services to the other 3 Domains 1 level down the tree. I have clicked the "No Override" option to prevent the policy from being overwritten further down the tree. Whats happening is that some of the settings in the Policy like the Warning message before logging on to a domain is being applied but the Account Policies like Password settings are not. Instead the computers on the domains are picking up the default settings for the domain they are on. They are not picking up the settings set in the root domain. Can anyone suggest what i need to do to get these to work from the top level.
