Thanks,

I only have one group policy running I placed it on the entire site. I logged the user on my computer and it picked up my internet settings. Then I logged on her computer and she had internet access but now the connection tab shows up but the lan settings are still grayed out. I did use the gp under user config, connection, proxy setting to tell all users of that machine to use the same proxy settings and I listed my proxy IP but I don't think that is what fixed it. Now I just need to find out what will make the LAN settings not grayed out.

Lessons learned, don't put gp at site level. When first setup I just used the default users container for my users.

Would the correct process be to setup a OU for all my users then apply gp to that OU and remove from site level? If I remove from site level is it going to cause a problem maybe leaving some policies where I cannot change them later? Also, how do I move the gp?

Also, do all my users have to be a member of domain users or is that just another group that allows security rights.

Does the system use domain users as a way to validate logins or something else?

Thanks for your help

Sherry
