

Is this a GPO setting or not?

I'm trying to duplicate a setting on a few of the machines I manage that will prevent users from logging into the machines unless I go through the Users and Passwords Control Panel item or Local Groups and User MMC snap-in and give them permission to logon to the machine. They initially have to be input into the machine this way with Admin access to the machine and then bumped down to a lower permissions level. If their profiles aren't manually added in this manner they get a message like this. "Cannot copy C:\Documents and Settings\Default User\Favorites\<insert url here> to C:\Documents and Settings\<insert User Name here>\Favorite\... etc" with a countdown time at the bottom. At the time out they get another message that basically tells them to contact the Network Admin because their profile could not be created on the machine. I don't have much authority over the User Domain accounts so I can't add them to specific OU except at the Local machine level but I have complete control over the machines themselves. Is this something that can be done via the GPO or Local Security Settings? Is there another MMC snap-in that I can use to duplicate this setting? This is the only way I've found so far to prevent users from logging into certain machines. The previous Network Admin can't remember what he did to activate this so I'm pretty much on my own. Thanks in advance for any and all help.

Charles
