Thanks Cary, I need to confess that I followed <http://www.jsiinc.com/SUBK/tip5300/rh5319.htm> for how to set up my restricted group, but I ignored the 'do this on a member server' bit and just added my choosen users to the 'administrator' group on the DC...!!! (this is the domain admin..right!....doh!!!...stupid!!) Then the Domain Admin access was lost. I then tried deleting the GPO and redoing the restricted group as per instructions on a workstation+adminpak, but the domain access still did not come back. I eventually gave up and deleted all traces of the groups and GPO, but still no access. What have I done? Would your fix below get back my <http://localhost> access, is that to do with IUSR?

any advice would be great..someone recommended I restore system state, but that is not going to be popular at work.
