Greetings.

Currently users pull desktop profiles through folder redirection policies, which are assigned to groups. Now, we have some users that use Terminal Services to access a Winframe server, but they are pulling those desktops from the policies and don't have access to certain programs. There is a field on the user property sheet in Active Directory that allows you to specify a Terminal Services profile, but it is overridden by Group Policy. Now, we want these people to pull that policy when logging on to their own PC, but not the Winframe server. We already have a tsweb client in place, which is why we're going that route.

Does anyone know if it is possible for us to use both folder redirection policies for local PCs, but the TS profile for logging in to the server? Any help is much appreciated.
