I was lucky and found an old script in a magazine. I just hacked it together to do what I wanted. It's amazing what you can do to shut up a whinging user. I had one user who like to log into his laptop (not plugged into the network) then plug it into the LAN and wanted his network drives mapped. He didn't want to see any errors like "mapped drive has not been restored' when he wasn't on the network.

The only way I could think to do it was to throw together an event trap that would detect when he got a legitimate IP address and run his login script.

> *side-tracked!*

Well I've only recently moved into a network admin role. My previous jobs have been writing applications and scripts, some of which were used by admins, so I've got a bit of a head start.....
