- 

my laptop is on the domain. i take it back and forth from work to home. At work, its fine because the dns is pointed to the AD dns server so it starts up fast.

But when i take it home, i get my ISP's dns server. so i guess applying computer settings and preparing network settings is slow

Also in order for me to log into the domain at home, i am running a cisco vpn client that starts up before i log in.

But the slowness is really before all that

its slow starting up at

preparing network settings..

and

applying computer settings

What do I have to do?

.
