This is not the default behavior.

If you look at the user object in AD, which security groups is the user member of?

Lock in as administrator and remove the dom-user from the local administrator group. Lock in as user, if he is admin again, then there is something that takes effect on the default behavior. In a GPO you can manipulate this via restricted groups. You mus configure this manually to change the default behavior, thats why I think, taht there is no entry.
