Hi,

I have some time on this problem and it seems that there must be some simple solution for it, so maybe someone already have solved it?

We have Windows 2003 domain with relatively simple OU structure, where each department's users and computers are placed in OUs, e'g' Sales OU has SalesUsers OU and Sales Computers OU, Research OU has Research Users and Research Computers OU and so on. Also we have Test OU and Domain Controllers OU.

There is also All Users GPO linked to domain that defines logout script in Users section. We needed to exclude certain users and computers from running this logout script and was quite straightforward with users – just put them in Nonlogoutscript Group and set Deny access for this group in GPO Security ACL.

However it does not restrict other users from running logout scripts on Test Machines and Domain Controllers because Logout scripts are defined in Users section of GPO .

I have tried using Loopback , but it did not make any difference.

If somebody would give me what direction should I turn, I would really appreciate it.

Thank you

.
