Whilst as Darren say's there is no native support for this, what you could do is write a simple vbscript to create the Registry key that you want as part of a machine startup or logon script.

Once the key is in place you can use registry security through GPO to apply security to the registry key.

Computer Configuration\Windows Settings\Security Settings\Registry

Unfortunately, ADMs don't support registry permissions. You might look at the old regdmp and regini utilities that, if I remember correctly, are part of the reskit. Regdmp can create regini formatted files that do include perms. Then you can monkey with the regini file to modify perms and then use a GP-based computer startup or user logon script to deliver the regini script.

Is there anyway to save a Registry Key in such a manner that the Key and its Permissions, preferably the Advanced Permissions, can be sent out via GPO?

I've been trying to make a Key with RegtoAdm but I haven't yet been able to get permissions into the Key.

Can .adm files even hold permissions? What does one look like with permissions?

thanks.
