Hi,

This is a single server you mention that is having this problem so I would not even think about restoring the sysvol.

Well the two NICs could deem a problem but on the NIC connected to the domain, make sure it is pointed to a DNS authoritative to your domain as primary DNS.

Question here is why it is not registering it's DNS records on it's own. Is the DHCP client service running on this machine?

Could it be that this server being unable to register it's records, it is unable to read records that it needs to read?

If this still fails, I would disjoin and rejoin this machine to the domain.

Good luck

I would prefer not to restore the Sysvol as no other servers or computers are experiencing any problems...I just dis-joined and rejoined but still receiving the errors. When I run GPRESULT, I get lots of LookupAccountSid failed with 1789 error
