Hi everyone –

I'm no expert in certificates, but I need to know how to push .CER and .PFX certificates down to anyone that logs in to this Directory.

We just tried installing SSL security for an application that we support and the certificates were installed for the users – not the computers.

I need to know either how to install the certificates for each workstation – no matter who logs on – or – how to push the certificates when the users log in.

Thanks for any help.

–Rik
