I am not sure I am posting this to the correct newsgroup, please let me know.

We have a computer in our office that will not maintain the correct time in the Windows Clock. When you set the time it will remain correct for a while and then it will jump ahead about 15 – 20 minutes and hold that time.

Does this mean the internal time in the computer is incorrect in the CMOS (i believe)?

Thank you in advance for your information.

Cindy
