I have Windows 2003 Server with Services for Unix 3.5 and File Server for Macintosh. We share a WIP folder to PC users, Macintosh OS9 and OSX users, and now AIX and Linux Unix clients. When I create folders/files in WIP using Linux/AIX clients, they can not be seen in the directory listing by Macintosh clients using AFP to mount the share. They are seen by Windows clients. They can also be seen using SMB under OSX. This is not available for OS9 and creates link problems with imported graphics

Creating a file/folder using Windows or Mac clients can be seen by everyone. Deleting the Mac share and re-creating it shows the files/folders created by Unix clients but this is not feasible in production environments.

Is this a bug? Am I missing some configuration? I've gone over it a hundred times. It seems like it would have been seen before but I can't find any info on the web.
